Novel cell lines for producing monoclonal antibodies that bind to a factor involved in hemostasis and coagulation cascade, useful for treating and preventing coagulation disorders. WPI; 2001-138333/14. N-PSDB; AAC85452.

Example 5; Fig 8; 55pp; English.

```
This sequence represents the heavy chain variable region of the monoclonal antibody (MAD), KRIXI. This MAD produced by the cell line of the invention, specifically recognises the wild type factor VIII light chain. KRIXI can be used to inhibit the binding of factor VIII light willebrand factor in a dose dependant manner. The new cell line KRIXI, is deposited with the Belgian Coordinated Collections of Micro-organisms, under accession number LMBP 5089CB. KRIXI, or fragments of it, optionally with a thrombolytic agent, are useful for the treatment and/or prevention of hemostasis, coagulation disorder or thrombotic pathologic condition such as intravascular coagulation, arterial thrombosis, arterial cestencies, venous thrombosis or arteriosclerosis, and attendant of coagulation in a mammal. An effective and safe antithrombotic therapy is provided which reduces the risk of bleeding in mammals, more particularly
                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.
                                                                                                                                                The present invention relates to a pharmaceutical composition for the prevention and/or treatment of systemic Inflammatory response syndrome (SIRS), sepsis, septic shock, thrombus formation in the microvasculature and disseminated intravascular coagulation in mammals, comprising as an extive ingredient a partial inhibitor of factor VIII, in admixture with a carrier. Such inhibitors may include the antibodies B02CII and KRIXI. The present sequence is the heavy chain variable region of KRIXI
                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 YSVHWVRQAPGQGLEWMGRINPNSGATDYAHKFQGRVTMSRDTSISTAYMELSRLTSDDT 120

The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibacterial, immunostimulant and anti-HIV such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody variable region heavy chain protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                        Score 611.5; DB 7

The invention relates to a novel human antibody (I), preferably a human monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (AILIM). (I) is useful for modulating signal transduction into a cell mediated by AILIM, for modulating proliferation of AILIM-expressing cells, for modulating production of a cytokine from AILIM-expressing cells, for modulating production of a cytokine from AILIM-expressing cells, and/or immune cytolysis or apoptosis of AILIM-expressing cells and/or immune cytolysis or apoptosis of AILIM-expressing cells (I) is useful for treating or prophylaxis of delayed type allergy. (I) is useful for treating and prevention, and for inhibiting the onset and/or advancement of the prophylaxis of delayed type allergy. (I) is useful for treating or transduction, and for inhibiting the onset and/or advancement of the cheumatoid arthritis, multiple sclerosis, autoimmune thyroiditis, allergic contact-type dermatitis, chronic inflammatory dermatosis, systemic lupus erythematosus, insulin-dependent diabetes mellitus, poortasis, autoimmune or allergic disorders, inflammatory dermatosis, poortasis, autoimmune or allergic disorders, inflammatory dermatosis, poortasis, autoimmune or allergic disorders, inflammatory dermatosis, caused by abnormal intestinal immunity, specifically inflammatory contacting disorders understained disorders such as ulcerative colitis, pneumonia, hepatitis, and pancreative colitis, pneumonia, hepatitis, and pancreative colitis, pneumonia, hepatitis, and pancreative colitis, pneumonia, hepatitis, and minipenicity to human, i.e., human anti-mouse antigenicity (HAMA) in a host. AAU743301 represent anti-human anti-mouse antigenicity (HAMA) in a host. Adva043301 represent anti-human

The present invention provides the coding and protein sequences for a number of human immune system associated proteins (HISABS). These can be used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation diseases. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atherosclerosis, crohn's disease, irritable bowel syndrome, multiple sclerosis, myasthenia gravis, osteoarthritis, rheumatoid arthritis, scleroderma, systemic lupus erythematosus, arteriosclerosis, cirrhosis and cancer

                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a human anti-tumour antigen monoclonal antibody (MAD) heavy chain variable region, useful in medicine, pharmacology and biochemistry. The isotype of a MAD secreted by the human/human hybridoma HT was determined to be mu and kappa. Human MAD was purified, and the antigen recognised by human MAD CLN"-IgM identified by western blotting

                                                                                                                                                                                                                                                                                                                                                                Protein sequences (AAR66295-51) are novel human immunoglobulin heavy chain sequences encoded by novel isolated genes. The genes (AA76839-7902) were isolated and cloned from a series of cosmid constructs: Y202; Y103, Y21; Y6,Y24; 3-31; M84, M118 and M131, by PCR amplification using primers AA078917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA mas partially digested with TaqI restriction enzyme. The fragments were separated by gel electrophoresis and 35-45 kb fractions were collected. The fragments were ligated with clar-digested cosmid vector pJ881. The ligation products were in vitro packed and infected into E.coli 490A. The fragments were then subcloned by colony hybridisation. The VH openes and the DNA fragments encoding them are useful in producing human immunoglobulin in mammalian hosts. (Updated on 25-MAR-2003 to correct PN

The present sequence is the human immunoglobulin superfamily protein IGPAM-7. Its gene was isolated from a CDNA library of bladder tumour lissue. It is expressed in reproductive, gastrointestinal and immune and haematopoietic tissue, where cancer and inflammation are common. The gene, protein, its antibodies, agonists and antagonists are suitable for diagnosing and treating many diseases, including cancer, immune system disorders (such as inflammation, AIDS, allergies, anaemia, arteriosclerosis, asthma, atherosclerosis, cholecystitis, Crohn's arteriosclerosis, generalitus, emphysema, Graves' disease, hepatitis, multiple sclerosis, psoriasis, rheumatoid arthritis, scleroderma, systemic lupus erythematosus and ulcerative colitis), complications of cancer, haemodialysis and extracorporeal circulation, trauma and haematopoietic cancer (such as leukaemia) and infections caused by bacteria, viruses, fungi or parasites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 20
                                                                                                                                                     Immunoglobulin superfamily proteins, the agonist and antagonist of the protein is useful for preventing and treating disorders associated with altered levels of the protein such as cancer, immune system disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MDWTWRILFLVAAATGAHSQVQLVQSGAEVKKPGASVKVSCKTSGYNFTGYSASGHIFTA

The present invention describes antibodies or their functional fragments that bind to TRAIL-R1 and/or TRAIL-R2. TRAIL-R1 and TRAIL-R2 antibodies have cytostatic and apoptotic activities, and can be used in antibody therapy. The antibodies can be applied as remedies and preventives of diseases due to cells expressing TRAIL-R1 and TRAIL-R2, which are useful in the therapy of malignant tumours. Remedies produced with the antibodies are highly safe, and avoid hepatotoxicity. The present sequence represents an anti-TRAIL-R antibody amino acid sequence from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New anti-TRAIL-R antibodies with activity of inducing apoptosis of cancer cells and without exerting an effect on normal cells expressing TRAIL-Rs nor inducing injury to hepatocytes, for use in therapy of malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20

called human colon cancer antigens, given in AABS3234 to AABS4006. The human colon cancer antigens, given in AABS3234 to AABS4006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; cheuroprotective, immunomodulatory, gyaecological, gastrointestinal, valuerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymuclectides, can be used in gene therapy. The colon cancer antigen polymuclectides, creatment and diagnosis of colon disorders, such as colon cancer. The polymuclectides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, wounds, renal disorders, reproductive disorders, immune system cardiovascular disorders, reproductive disorders, immune system cardiovascular disorders. AAC9874 to AAC98772 and AABS4007 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ω

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                   This polypeptide comprises the heavy chain variable region of the recombinant human monoclonal antibody (MAD) 4B5. 4B5 recognises

C antibodies specific for GD2 antigen antibodies. Antibodies specific for GD2 recognise various cancers including glioblastoma, neuroblastoma, compared and/or metastatic melanoma, breast adenocarcinoma, lung carcinoma, colon adenocarcinoma and denocarcinoma. The invention encompasses 4B5 derivatives with immunologic specificity for antibodies specific for GD2. These contributions and prostate adenocarcinoma. The invention encompasses 4B5 derivatives with immunologic specificity for antibodies specific for GD2. These contributions and regions spanning the 4B5 CDRs. Other derivatives include Fab, F(ab/)2, Fab', scrv and isolated heavy and light chains (see also VDJ junction and regions spanning the 4B5 CDRs. Other derivatives include Fab, F(ab/)2, Fab', scrv and isolated heavy and light chains (see also VDJ junction and regions are also provided, and therapeutic plasmids and vectors, including vaccinia virus vectors, comprising these antibody V regions are also provided, and therapeutic plasmids and vectors including vaccinia virus vectors, comprising these controlled fabs has been shown to minic GD2, and is particularly cuseful in generating a host immune response to cancer. Products of the invention can be used in the detection and treatment of e.g. astrocytoma, colligodendroglinma, peptodyma, medulloblastoma, printing and increases includence and encocarcinoma, squamous cell carcinoma, squamous and adenocarcinoma, squamous and adenocarcinoma, prostatic adenocarcinoma, cholangiocarcinoma, presst tumours such as ductal and lobular adenocarcinoma, presst tumours such as ductal and lobular cut adenocarcinoma, prostatic adenocarcinoma, cuterine and ovarian epithelial carcinoma, prostatic adenocarcinoma, cuterine and ovarian epithelial carcinoma, prostatic adenocarcinoma, cuterine and ovarian epithelial adenocarcinoma, prostatic adenocarcinoma cut adenocarcinoma soft tissue sarcoma and l
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4

This invention describes novel antibodies that immunospecifically bind to be Lymphocyte Stimulator (BLyS) polypeptides. BlyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunoadulatory, antitheumatic and antiAnDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant ElyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatodia arthitis, immunodeficiency (CVID) propression and activity such as cancer, immunodeficiency (CVID) and activity such as cancer and activity such as cancer and activity such as cancer and activity such as cancer and activity such as cancer and activity such as cancer and activity such as cancer and activity such as cancer and activity such as cancer and activity and activity and activity and activity and activity and activity and activity and activity an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        INPNSGATDYAHKFQGRVTMSRDTSISTAYMELSRLTSDDTAMYYCARADNYFDIVTGYT 139

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the present of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopoiesis, and in bone, cartilage, tenden and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukeemias. AAU39510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX90020 to AAX90029 encode monoclonal antibodies which react with human connective tissue growth factor (CTGP). AAY24369 to AAX24378 represent these monoclonal antibodies. The antibodies are useful in the diagnosis, prevention and treatment of cell proliferation disorders in which CTGF is, implicated, including fibrosis of lung, Kidney, liver and other tissues; liver cirrhosis; nephritis; skin ulcers and keloid; rheumatod arthritis; rheumatic vascular inflammation; hepatitis; and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

```
The present invention describes a recombinant antibody (A) which binds to fas antigen, and controls and induces apoptosis in cells which expressed fas antigen. The complementarity determining regions (CDR) of (A) contain amino acid sequences obtained from a mammal other than human, other regions contain amino acid sequences from human and they partly contain modified amino acids. A) has immunosuppressive activity, (A) is used for treating and/or diagnosing autoimmune diseases. The present sequence represents a specifically claimed heavy chain variable region of (A)
                                                                                                                                                                                                       Novel recombinant antibody used for treating and diagnosing autoimmune diseases - is humanized anti-Fas antibody which controls and induces apoptosis in cells expressing fas antigen.
                                                                                                                         (IGAK-) IGAKU SEIBUTSUGAKU KENKYUSHO KK.

GENERAL INFORMATION:

APPLICANT: O. Collen Research Foundation vzw
APPLICANT: Jacquenin, Marc G

APPLICANT: Jacquenin, Marc G

APPLICANT: Saint-Remy, Jean-Maries

TITILE OF INVENTION: Method and pharmaccutical composition for preventing
TITILE OF INVENTION: Method and/or treating systemic inflammatory response syndrome
CURRENT APPLICATION NUMBER: US/10/044,569B

CURRENT APPLICATION NUMBER: US 60/261,405

PRIOR FILING DATE: 2001-01-11

PRIOR APPLICATION NUMBER: US 60/261,405

Sequence 10, Application US/09582337

Sequence 10, Application US/09582337

Patent No. 6562618

GENERAL INFORMATION:

APPLICANT: Japan Tobacco, Inc.

TITLE OF INVENTION: Monoclonal Antibody Against Connective Tissue Growth Factor

TITLE OF INVENTION: and Medicinal Uses Thereof

FILE REFERENCE: J1-099PCT

CURRENT APPLICATION NUMBER: US/09/582,337

CURRENT FILING DATE: 2000-06-23

FRIOR APPLICATION NUMBER: UP P1997-367699

FRIOR FILING DATE: 1997-12-25

PRIOR FILING DATE: 1988-12-15

SPRIOR FILING DATE: 1988-12-15

NUMBER OF SEQ ID NOS: 27

SEQ ID NO 10

SEQ ID NO 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    51 HWMHWVRQAPGQGLEWVGEFNPSNGRTNYNEKFKSRVTMTLDTSTNTAYMELSSLRSEDT 110

RESULT 2 PL0106

Ig kappa chain precursor V-J-C region (LS1) - human (fragment)
C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)
C;Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 21-Jan-2000
C;Accession: PLO106
R;Silberstein, L.E.; Litwin, S.; Carmack, C.E.
R;Silberstein, L.E.; Litwin, S.; Carmack, C.E.
A;Tille: Relationship of variable region genes expressed by a human B cell lymphoma sec
A;Reference number: PLO106; MUID:89235583; PMID:2541221
A;Accession: PLO106.

A;Molecule type: mRNA
A;Residues: 1-144 <SIL>
C;Superfanily: immunoglobulin V region; immunoglobulin homology
C;Reywords: heterotetramer; immunoglobulin
E;1-20/Domain: signal sequence #status predicted <SIG>
F;21-115/Domain: V region <VRE>
